Disclaimer - I need to update my slides and presentation for aap 2. As it stands, some of the terms (minor little things like engine, tower) are outdated.

Compared to my Smart Management presentation, this Ansible presentation does a bit more on the presentation side. Not that every Ansible presentation does, just that that is how my presentation evolved. As you go through my presentation, you'll see that I do a little bit of introduction, then some ansible engine examples, then more slides, then more demonstration. The idea here is that I again first address, "why should I care?", in slides 4-8, then I talk a little about ansible, then some basic examples using ansible engine, then I get into tower / aap / cloud.redhat.com. For the tower side, I start off by showing the dashboard in the webui and then templates, credentials, and projects. I then show kicking off templates, updating a project in git, and then running that template to show how it can automatically pull the latest version from git. Discuss things like rbac (slide 28, but now show that in tower), configuring settings / authentication to use ldap or something like that, and using the api:
https://tower.example.com/api/v2/
